CARBON STEELS
STRUCTURAL STEEL

DESCRIPTION

High recovery basic coated electrode

High efficiency heavy coated basic type electrode. Suitable for plain and fillet weld, smooth fusion without spatter loss, easy deslagging, regular and of good appearance. This electrode is mainly used for medium section steel fabrication, tanks building, shipyards and in general where a high speed welding is required. Ease of slag removal reduces post-welding cleaning operations to a minimum.

SPECIFICATIONS

EN ISO 2560-A	E 42 2 B 83	AWS A5.1	E7028
Shielding	-	Positions	PA, PB
Current	AC, DC+	Packaging Type	Carton box and dry pack

ASME QUALIFICATIONS

F-No (QW432)	1
A-No (QW442)	1

CHEM. COMP. %	DEFAULT	MECHANICAL PROPERTIES	MIN. PER STANDARD	PRODUCT
C	0.07	Tensile strength R_m MPa	490	510
Mn	1.2	Yield strength $R_{p0.2}$ MPa	420	420
P	0.02	Elongation A ($L_0=5d_0$) %	22	26
S	0.01	Impact Charpy ISO-V	27J @ -20°C	47J @ -20°C
Si	0.5	Impact Charpy ISO-V	-	-

WELDING PARAMETERS	2.5 mm	3.2 mm	4.0 mm	5.0 mm
Ampere	50A - 80A	80A - 120A	110A - 160A	160A - 200A
Voltage	-	-	-	-
Packaging	30 pcs/kg	18 pcs/kg	12 pcs/kg	8 pcs/kg
Packaging Type	Carton box and dry pack	Carton box and dry pack	Carton box and dry pack	Carton box and dry pack

NOTES

Pcs/kg is indicative, actual number may vary \pm 5%.

STRUCTURAL STEEL

DESCRIPTION

CARBON STEELS
STRUCTURAL STEEL

APPLICATION

Carbon-manganese steels (C-Mn) are the backbone for a wide range of applications in the structural engineering industry. Welding of these steel structures can be successfully achieved provided the material composition is known, appropriate precautions are adopted, and qualified procedures are followed. Weldability varies based on the type of C-Mn steel, and there is a risk of defects such as hydrogen cracking, solidification cracking, or reheat cracking, which depend on specific operating conditions. The proposed consumables offer effective resistance to these issues, emphasizing the importance of a carefully defined welding process. Preheating and post-weld heat treatment (PWHT) are not always necessary, but their adoption depends on the type and thickness of the base material. The desired mechanical properties in the welded joint can be achieved using appropriate consumables. However, the complex structural transformations that occur during the welding thermal cycle require careful evaluation of critical parameters such as the toughness and hardness of the heat-affected zone (HAZ).

ALLOY TYPE

Consumables for welding mild and C-Mn steels of 340-510MPa tensile strength.

MICROSTRUCTURE

Predominantly ferrite.

MATERIALS

Carbon and carbon-manganese steels encompass a wide range of structural and pressure-grade materials commonly used in construction, mechanical engineering, and industrial plant applications. Among the EN-standardized grades are non-alloy structural steels intended for general use, known for their good weldability and progressively higher mechanical strength. The "P" grades, on the other hand, are pressure vessel steels typically used in boilers and heat exchangers. Equivalent ASTM specifications cover a similar scope of applications and are widely adopted internationally for structural components, piping, and fittings exposed to pressure or high temperatures. Lastly, API specifications are typical of the oil & gas sector, particularly for the production of pipelines used in hydrocarbon transport, offering increasing levels of mechanical strength and specific performance requirements.
